

PelGar International is a leading manufacturer of rodenticide and insecticide products for the control of public health and agricultural (non-crop) pests. **Simon King** met **Nic Blaszkowicz**, the company's UK & Ireland business manager

Simon King: Please can you give me a background to PelGar, its history and product line-up

Nic Blaszkowicz: PelGar International was founded in 1995 by entomologists Dr Gareth Capel-Williams and Dr Jonathan Wade with the aim of developing innovative and novel rodenticides for the public health pesticide market. The company invested in three main active ingredients and a programme of research and development to improve existing and create new formulations to meet the needs of varying species and environmental factors.

Twenty years later PelGar purchased manufacturer Agropharm, with which it had been working for some

years to secure a sister portfolio of insecticides. The company is now the leading public health pesticide manufacturer in the UK and sells in more than 60 countries globally, with over 500 product registrations. All products are developed, trialled and manufactured in the UK.

SK: Can you explain the new regulations that classify rodenticides, and what stores need to do to ensure they comply?

NB: To sell any professional rodenticides all stores now need to be registered with BASIS for annual inspection. They then need to check certificates of competence or membership of an approved farm assurance scheme prior to supplying customers. Full details can be found on the CRRU (Campaign for Responsible Rodenticide Use) website, www.thinkwildlife.org. Users who don't fall into this professional category are now limited to baits with a 25ppm strength and maximum pack size of 300g, but there is no limit on the number of packs they can buy. We don't advise stockpiling but do encourage people to buy enough bait to get on top of their infestations, under-baiting is a false

economy and the biggest reason for control failure.

SK: What are the key pests at this time of year?

NB: Autumnal pests are definitely our commensal rodents, namely the brown rat and house mouse (*Rattus norvegicus* and *Mus musculus*). Come autumn, the last grains in the fields and fruit in the hedgerows are quickly devoured and rodents go in search of a sustainable food source. This is often found on the farmyard, where there will always be accessible food, or in the gardens of smallholders and rural home owners who may be feeding livestock or birds through the winter. In more urban environments rodents can be a year-round problem as they do not have the same ability to migrate back to the fields and hedgerows in the spring to find food.

SK: Can you detail PelGar's R&D programme?

NB: The active ingredients we are working with today in rodent and insect control are, in some cases, based on 50-year-old technology. To combat resistance, especially with insects, PelGar is constantly looking at ways to combine different

insects, although it can be less effective against crawling insects; whereas will give better residual control when dealing with tougher pest problems.

big part – our broad-multi-active ingredient product Cimetrol Super would be

active ingredients to create novel and effective formulations suited to a wide range of applications. We are one of the few manufacturers to combine multiple actives with different modes of action in our insecticides to further improve their

reviews and most of the investment companies like PelGar are having to make is in new studies and renewal of current products, reducing the time active ingredients.

SK: What are the 'star' products from the PelGar range?

NB: In the rodenticide and insecticide markets, active ingredients are 'cast' wax block rodenticide, making ideal for use in damp and humid situations. In the agricultural sector, concentrate for crop treatment.

this product can be applied with just a 24-hour withdrawal, removing just before harvest. Our range of generators, in range of sizes, can insects.

SK: What advice do you have for people that believe there is a 'universal' insecticide?

NB: While a universal insecticide doesn't work in practice and that products to suit various situations. For example, an aerosol is ideal

and can be supported with the use of an insecticidal smoke generator and an insecticidal dust to use where liquids are not ideal for use, i.e. in and around electrical outlets. The ask professional companies, such as PelGar, for help and advice.

SK: How important are country stores to the sale of your products?

NB: of PelGar's UK business and allow with the support of local retailers. feet on the ground, visiting farms and passing on their help and valuable product knowledge.

SK: What advice do you have on selling the products?

NB: Ask questions, understand the problems customers are facing, the dealing with and then advise the most appropriate products for the customer to use. As a rough guide, nocturnal animals. If baiting is the preferred method of control, and alternatives should be considered, grain should be baited with a is critical then block baits can be anchored inside bait stations, or if

“ Our biggest area of support is through our four regional account managers ”

there are multiple foods available, then paste baits, which are high help to tempt from other food sources.

SK: How do you support retail customers?

NB: Our biggest area of support is through our four

of rodenticides and spend a considerable amount of time in store training staff on our products, on the and top tips in rodent control, so

Some retailers like to have dedicated product specialists, while our regional account managers like to give a level

The regional account manager can marketing team, we are redeveloping hub for product information, labels

Following on from this will be our more consumer-based sites, which give help and advice at grass-roots level. While all of this is in development, we have our YouTube channel, which has the popular Six Steps to Successful Rodent Control video and guides users through the best process on which to base their rodent control campaigns. ■
